Dear John:

I consult for many animal industries in my consultancy. Most of these units are large and animals are raised in total confinement for management purposes. In such conditions, we find animals stressed and are more susceptible to disease. Therefore, I look for solutions, products and practices for my recommendations in raising healthier animals. Stalosan F is one of these solutions.

I use Stalosan F is dairy cattle and swine units. For free stall lactating dairy cows, I recommend to the dairyman to sprinkle Stalosan F on the bedding (sand, straw or mats). I discover less mastitis in lactating cows, less ammonia production in the barn and less fly populations. Also, I recommend a dusting of Stalosan F in calf hutches daily to prevent infection in calves and fewer odors around the premise. Again, the fly population is less extensive.

Also, I find Stalosan F to be a "*first-line defense*" in preventing the spread of virus bacteria, parasites and fungi between animals. And, I also use this product as a "*drying agent*" to absorb moisture in the swine lactation rooms and piglet nurseries. In North America, the most prominent health challenge in swine units are porcine reproduction respiratory syndrome (PRRS) and circo virus type 2 virus. Again, I find the use of Stalosan F to help in reducing the spread of such virus infections. The use of Stalosan works effectively as a management tool in aiding the health status of these units.

I find weekly use of Stalosan F to be a standard management recommendation I have for dairy and swine producers throughout North America. I like the low dosage of the product. Stalosan F is safe to use and works effectively into the daily farm management programs.

With kindest regards,

Gary Boyett
